

## Claims

What is claimed is:

- 1           1.     Apparatus for word synchronization with large coding distance  
2     and fault tolerance for a partial-response maximum-likelihood (PRML) data  
3     channel in a direct access storage device (DASD) comprising:  
4           a Viterbi detector for receiving equalized PR4 samples including a  
5     predefined word synchronization pattern; said Viterbi detector being  
6     optimized for said predefined word synchronization pattern; said Viterbi  
7     detector including  
8           a two-state Viterbi trellis; and  
9           a word synchronization detector for said two-state Viterbi trellis.
- 1           2.     Apparatus for word synchronization with large coding distance  
2     and fault tolerance as recited in claim 1 wherein said two-state Viterbi trellis  
3     and said word synchronization detector are operated on a 2T basis, where  
4     1/T is the sample rate.
- 1           3.     Apparatus for word synchronization with large coding distance  
2     and fault tolerance as recited in claim 1 wherein said predefined word  
3     synchronization pattern includes multiple pattern match sequences.
- 1           4.     Apparatus for word synchronization with large coding distance  
2     and fault tolerance as recited in claim 1 wherein said predefined word  
3     synchronization pattern includes three pattern match sequences.
- 1           5.     Apparatus for word synchronization with large coding distance  
2     and fault tolerance as recited in claim 1 wherein said predefined word  
3     synchronization pattern includes a repetition code including pairs of zeros  
4     and pairs of ones.
- 1           6.     Apparatus for word synchronization with large coding distance  
2     and fault tolerance as recited in claim 1 wherein said predefined word  
3     synchronization pattern includes only even length magnets.

1           7.     Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 1 wherein said word synchronization  
3 detector implements a difference metric for said two-state Viterbi trellis and  
4 includes a three-way multiplexer.

1           8.     Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 7 wherein said three-way multiplexer  
3 includes an input of added incoming samples, said added incoming samples  
4 represented by  $(Y_{K-2} + Y_{K-3})$ .

1           9.     Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 8 wherein said three-way multiplexer  
3 includes an input of added and shifted incoming samples, said added and  
4 shifted incoming samples represented by  $(Y_{K-2} + Y_{K-3}) + 4$ .

1           10.    Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 9 wherein said three-way multiplexer  
3 includes an input of a difference metric, said difference metric represented  
4 by  $DS_{K-4}$ .

1           11.    Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 10 wherein said three-way multiplexer  
3 includes select inputs for selecting said added incoming samples  $(Y_{K-2} +$   
4  $Y_{K-3})$  responsive to said added incoming samples  $(Y_{K-2} + Y_{K-3})$  being  
5 greater than or equal to said difference metric  $DS_{K-4}$ .

1           12.    Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 10 wherein said three-way multiplexer  
3 includes select inputs for selecting said added and shifted incoming samples  
4 represented by  $(Y_{K-2} + Y_{K-3}) + 4$  responsive to a shifted difference metric  
5  $DS_{K-4} - 4$  being greater than or equal to said added incoming samples  $(Y_{K-}$   
6  $2 + Y_{K-3})$ .

1           13. Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 10 wherein said three-way multiplexer  
3 includes select inputs for selecting said difference metric  $DS_{K-4}$  responsive  
4 to a shifted difference metric  $DS_{K-4} - 4$  being less than said added incoming  
5 samples  $(Y_{K-2} + Y_{K-3})$  and said added incoming samples  $(Y_{K-2} + Y_{K-3})$   
6 being less than said difference metric  $DS_{K-4}$ .

1           14. Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 1 wherein said word synchronization  
3 detector implements a difference metric for said two-state Viterbi trellis and  
4 includes a path memory providing detected output decisions  $a_{K-13}, a_{K-12}$ .

1           15. Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 14 wherein said detected output  
3 decisions  $a_{K-13}, a_{K-12}$  of said path memory are compared by a word sync  
4 pattern compare function with said predefined word synchronization pattern;  
5 said predefined word synchronization pattern including multiple pattern  
6 match sequences.

1           16. Apparatus for word synchronization with large coding distance  
2 and fault tolerance as recited in claim 16 wherein said word sync pattern  
3 compare function identifies at least a predefined subset of said multiple  
4 pattern match sequences and generates a start of data trigger for the partial-  
5 response maximum-likelihood (PRML) data channel.

1           17. A method for word synchronization with large coding distance  
2 and fault tolerance for a partial-response maximum-likelihood (PRML) data  
3 channel in a direct access storage device (DASD) comprising the steps of:  
4           sensing a readback signal including a predefined word  
5 synchronization pattern; said predefined word synchronization pattern  
6 including multiple pattern match sequences;  
7           providing a dedicated Viterbi detector optimized for said predefined  
8 word synchronization pattern and said Viterbi detector including a two-state  
9 Viterbi trellis and a word synchronization detector for said two-state Viterbi  
10 trellis;  
11           applying equalized PR4 samples from said readback signal including  
12 said predefined word synchronization pattern to said dedicated Viterbi  
13 detector;  
14           detecting a predefined number of said multiple pattern match  
15 sequences of said predefined word synchronization pattern with said Viterbi  
16 detector; and  
17           generating a start of data trigger for the partial-response maximum-  
18 likelihood (PRML) data channel.

1           18. A method for word synchronization with large coding distance  
2 and fault tolerance for a partial-response maximum-likelihood (PRML) data  
3 channel as recited in claim 17 wherein the step of sensing a readback signal  
4 including said predefined word synchronization pattern includes the step of  
5 generating said predefined word synchronization pattern including only even  
6 length magnets.

1           19. A method for word synchronization with large coding distance  
2 and fault tolerance for a partial-response maximum-likelihood (PRML) data  
3 channel as recited in claim 17 wherein the step of providing a dedicated  
4 Viterbi detector optimized for said predefined word synchronization pattern  
5 includes the step of optimizing said Viterbi detector by eliminating branches  
6 from said two-state Viterbi trellis, thereby increasing coding distance.

1           20.    A method for word synchronization with large coding distance  
2   and fault tolerance for a partial-response maximum-likelihood (PRML) data  
3   channel as recited in claim 17 wherein said predefined word synchronization  
4   pattern includes three pattern match sequences and where the step of  
5   detecting said predefined number of said multiple pattern match sequences  
6   of said predefined word synchronization pattern with said Viterbi detector  
7   includes the step of detecting two of said three pattern match sequences of  
8   said predefined word synchronization pattern.
